CRYPTO WEEKLY

NOT A CRASH, JUST A REALITY CHECK

IMPORTANT INFORMATION

This weekly report is prepared by the Foxian Research Team for informational and educational purposes only. The content provided does not constitute financial advice, investment advice, or any recommendation to buy, sell, or hold any cryptocurrency. Cryptocurrency markets are highly volatile and unpredictable, and past performance does not guarantee future results. While we work hard to provide accurate information based on publicly available data, we make no guarantees about the completeness or accuracy of this content. All investment decisions are your own responsibility, and you should always do your own research and consult with a qualified financial advisor before making any trading decisions. Never invest money you cannot afford to lose. The Foxian Research Team and its members will not be held liable for any losses or damages that may arise from using the information in this report. Cryptocurrency regulations vary by region, so make sure you understand and comply with all laws that apply to you. By reading this report, you acknowledge that you understand the risks involved in cryptocurrency trading and accept full responsibility for your investment decisions. Stay safe, stay informed, and invest responsibly.

METHODOLOGY

This section outlines our data collection, analytical framework, and quality control processes to ensure transparency and institutional-grade research standards.

Data Sources Price & Market Data: CoinGecko, CoinMarketCap, Binance API, Coinbase Pro API, Messari. All timestamps standardized to UTC with Sunday 00:00 as weekly start. On-Chain Metrics: Glassnode (active addresses, transaction volume, MVRV), IntoTheBlock (exchange flows, holder behavior), Santiment (social volume, development activity). Sentiment Indicators: Fear & Greed Index (Alternative.me), funding rates (Binance, Bybit, OKX, Deribit), stablecoin dominance calculations. Institutional Data: Bitcoin/Ethereum spot ETF flows (SEC filings via Farside Investors, Bloomberg Intelligence), CME futures positioning (CFTC COT reports). Macroeconomic Data: ISM PMI, Non-Farm Payrolls, CPI, DXY, 10-Year Treasury yields, S&P 500 (from official sources: BLS, ISM, Treasury, ICE Futures).

Analytical Framework Technical Analysis: Support/resistance identified via volume profile analysis (90-day), historical price pivots, psychological levels, and moving averages (50/100/200-day). Levels confirmed broken on daily closes (00:00 UTC) with volume confirmation. Volatility: GARCH(1,1) model measuring realized volatility over 30-day rolling windows, expressed as annualized percentage. Bitcoin baseline: 70-80%, calm periods: 30-40%, panic: 100%+. Dominance Metrics: Bitcoin dominance (BTC market cap / total crypto), stablecoin dominance (major stablecoins / total crypto), altcoin market cap (total minus BTC and ETH). Correlation Analysis: 30-day rolling Pearson coefficients between Bitcoin and S&P 500/DXY/Gold/Nasdaq. Strong correlation: $>+0.7$, weak: $<+0.3$.

Quality Control Process Dual-Source Verification: All price data confirmed across minimum two independent providers. Discrepancies $>1\%$ investigated and noted. Direct API Access: Data pulled directly from official sources rather than aggregators. Internal timestamp documentation for all metrics. Peer Review: Each section reviewed by second analyst for accuracy, consistency, and clarity. All calculations independently verified. Source Hierarchy: Tier 1 (always covered): Official regulatory announcements, verified company statements. Tier 2 (if material): Established financial media, credible analyst reports. Tier 3 (verify first): Social media, unconfirmed rumors.

Scenario Methodology Bull/bear scenarios are probability-weighted frameworks, not predictions. Built through: (1) Technical trigger identification (key price levels), (2) Supporting evidence chains (ETF flows, sentiment, macro), (3) Macro context integration (Fed policy, USD strength, regulations), (4) Internal probability assessment to calibrate language confidence.

Limitations Data Lag: Institutional data may have 1-3 day delays. Exchange Variations: Price discrepancies across exchanges due to liquidity/geography noted when $>1\%$. On-Chain Accuracy: Active addresses filtered for known exchanges but may include some internal transfers. Black Swan Events: Analysis based on current conditions; unexpected events may invalidate scenarios.

MARKET SCENARIOS & OUTLOOK

EXECUTIVE SUMMARY

The crypto market experienced a sharp correction during the week of February 1-7, 2026, but it wasn't a full-blown crash. Bitcoin dropped from \$77,000 to a low of \$59,000 before recovering to \$71,000. Ethereum fell from \$2,300 to \$1,740 and climbed back near the \$2,050 mark. The total market cap shed about 20%, falling from \$2.56 trillion to \$2.05 trillion before bouncing back to \$2.40 trillion.

Key support levels broke across the board. Bitcoin's \$73,000 support and Ethereum's \$2,050 zone both turned into resistance levels. Altcoins got hit harder, with drops ranging from 20-35%, though many have since recovered partially. Major tokens like Solana fell from \$101 to \$67, while XRP dropped from \$1.59 to \$1.11.

The selloff was triggered by traditional markets pulling back from risk, not by internal crypto issues. Strong US manufacturing data on February 2 boosted the dollar and pressured risk assets. The ISM Manufacturing PMI came in at 52.6, beating expectations and signaling economic strength that reduced the need for rate cuts.

Market sentiment hit rock bottom. The Fear and Greed Index dropped to 9 on February 5, the lowest since June 2022. Stablecoin dominance spiked to 14.48% as traders rushed to safety. Bitcoin volatility jumped above 55% during the decline. Network activity increased, with daily active addresses reaching 845,000 despite falling prices, showing real user engagement during the chaos.

Institutional flows were mixed. Bitcoin ETFs saw \$0.56 billion in inflows early in the week but then reversed sharply, with \$0.55 billion flowing out on Wednesday. This suggests big players reduced exposure during the correction. Ethereum funding rates went negative across exchanges, indicating traders were positioning for more downside.

China added to the uncertainty by tightening crypto rules, specifically targeting unauthorized stablecoins and real-world asset tokens. However, the country remains open to controlled tokenization within regulatory boundaries.

Some analysts see a silver lining. Bernstein noted that Bitcoin might be forming a bottom around \$60,000, and the correction could be in its later stages. The recovery from the lows suggests buyers are willing to step in at these levels.

The week closed with markets in a better position than the worst moments, but still below where they started. Bitcoin and Ethereum need to reclaim their former support zones to confirm any bullish reversal. For now, the market remains in consolidation mode, digesting the volatility and waiting for the next directional signal.

KEY TAKEAWAYS

Sharp but recoverable correction: The market dropped 20% overall, with Bitcoin falling to \$59,000 and Ethereum to \$1,740, but both recovered significantly. This looks more like a healthy reset than a complete breakdown.

Support turned to resistance: Bitcoin's \$73,000 level and Ethereum's \$2,050 zone both broke and flipped to resistance. Reclaiming these levels will be critical for confirming any bullish continuation.

Traditional finance drove the selloff: The crypto crash wasn't caused by internal problems. Strong US economic data made the dollar stronger and pushed investors away from risky assets, hitting crypto first and hardest.

Extreme fear and high volatility: The Fear and Greed Index hit, stablecoin dominance jumped to 14.48%, and Bitcoin volatility exceeded 55%. These are classic signs of panic selling.

Possible bottom formation: Analysts from Bernstein suggest Bitcoin may be forming a bottom around \$60,000. The strong recovery from lows and increased network activity show genuine buying interest at these price levels

BITCOIN, ETHEREUM AND TOTAL WEEKLY OVERVIEW

BITCOIN WEEKLY OVERVIEW

Bitcoin started the week at \$77,000 but quickly faced selling pressure. The critical \$73,000 support level, which we highlighted last week, was broken with daily closes confirmed below this zone. Price continued lower, reaching \$59,000 on February 5th before recovering to the current level of \$71,000. With the \$73,000 support now flipped to resistance, the weekly close becomes particularly important. A close above this level would signal strength, while sustained trading below confirms the bearish shift. Market participants should closely monitor price action around this pivotal zone in the coming sessions.

ETHEREUM WEEKLY OVERVIEW

Ethereum started the week at \$2,300 but followed a similar bearish pattern. The \$2,050 support zone, highlighted in last week's report, was broken with daily closes confirmed below this level. Price dropped further to reach \$1,740 on February 6th before staging a recovery. Ethereum is now trading at the edge of the \$2,050 resistance zone, which previously acted as support. A break and close above this level would signal renewed strength and could lead to further upward movement. However, failure to reclaim this zone may result in continued consolidation or potential downside pressure.

TOTAL WEEKLY OVERVIEW

The total cryptocurrency market cap started the week at \$2.56 trillion but faced significant selling pressure across the board. On February 6th, the market capitalization dropped to \$2.05 trillion, marking a substantial correction of approximately -20% from the weekly open. Since then, the market has shown signs of recovery, currently standing at \$2.40 trillion. This rebound indicates some buying interest returning to the broader market, though the recovery remains incomplete. The overall market structure will be crucial in determining whether this represents a genuine reversal or simply a relief bounce within a larger corrective phase.

ALTCOINS AND MARKET DOMINANCE

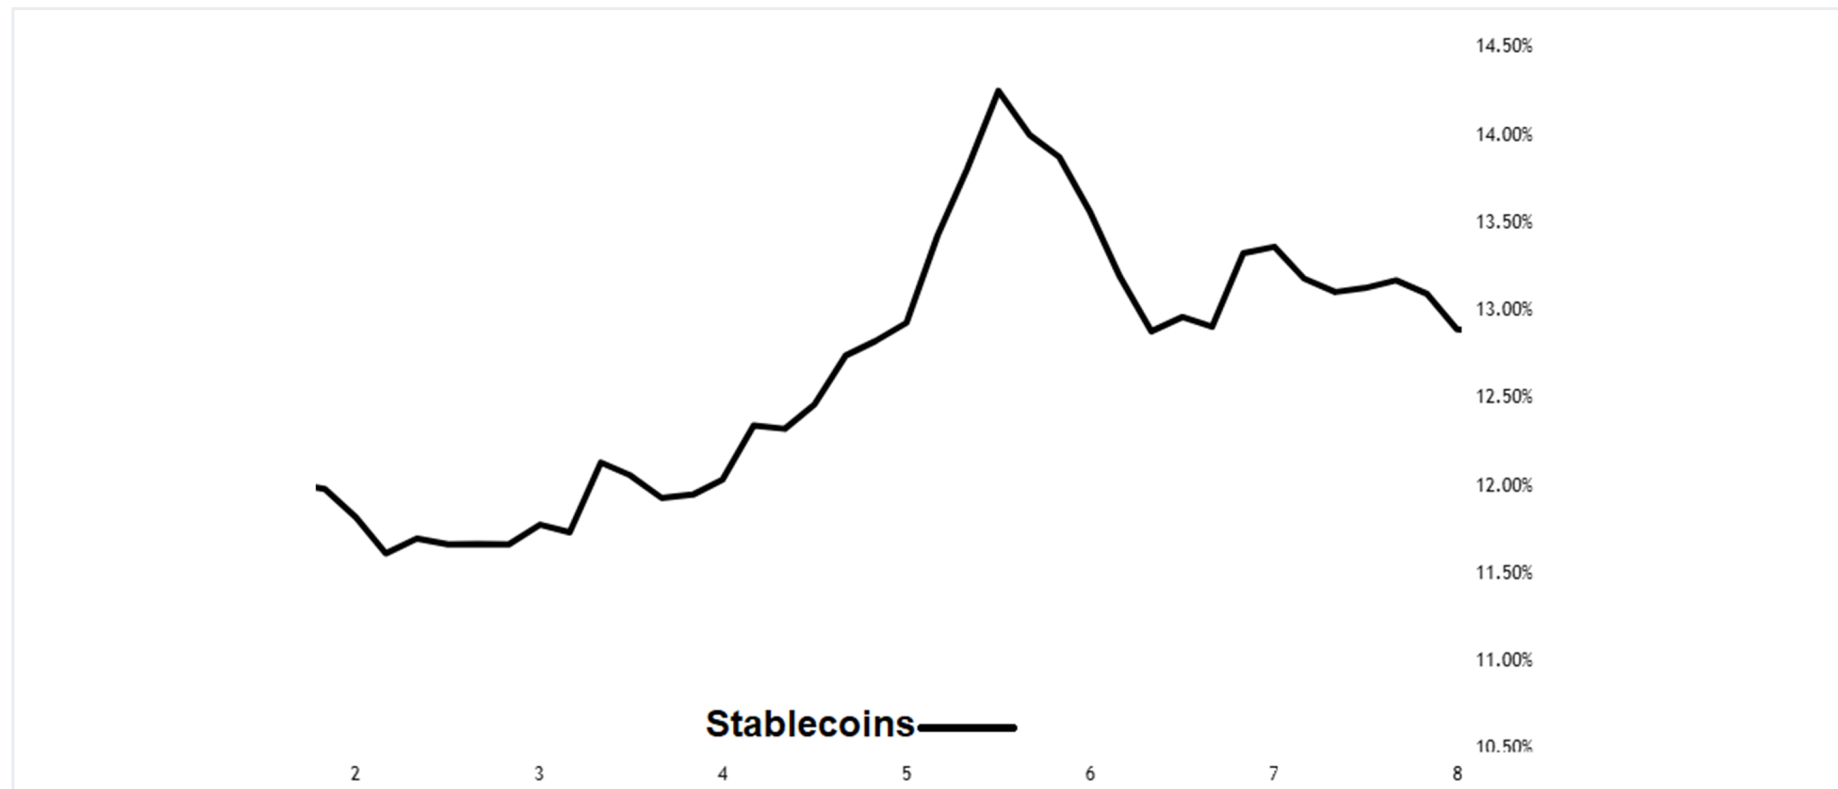

BITCOIN DOMINANCE WEEKLY OVERVIEW

Bitcoin dominance opened the week at 59.94% but experienced a decline as altcoins showed relative strength during the initial sell-off. Dominance dropped to 58.3% on February 6th, suggesting that Bitcoin was underperforming compared to the broader altcoin market during this period. However, dominance has since recovered and is currently sitting at 59.46%, indicating that Bitcoin has regained some of its market share. This fluctuation reflects the dynamic relationship between Bitcoin and altcoins during volatile market conditions, with the current level suggesting a relatively balanced market structure.

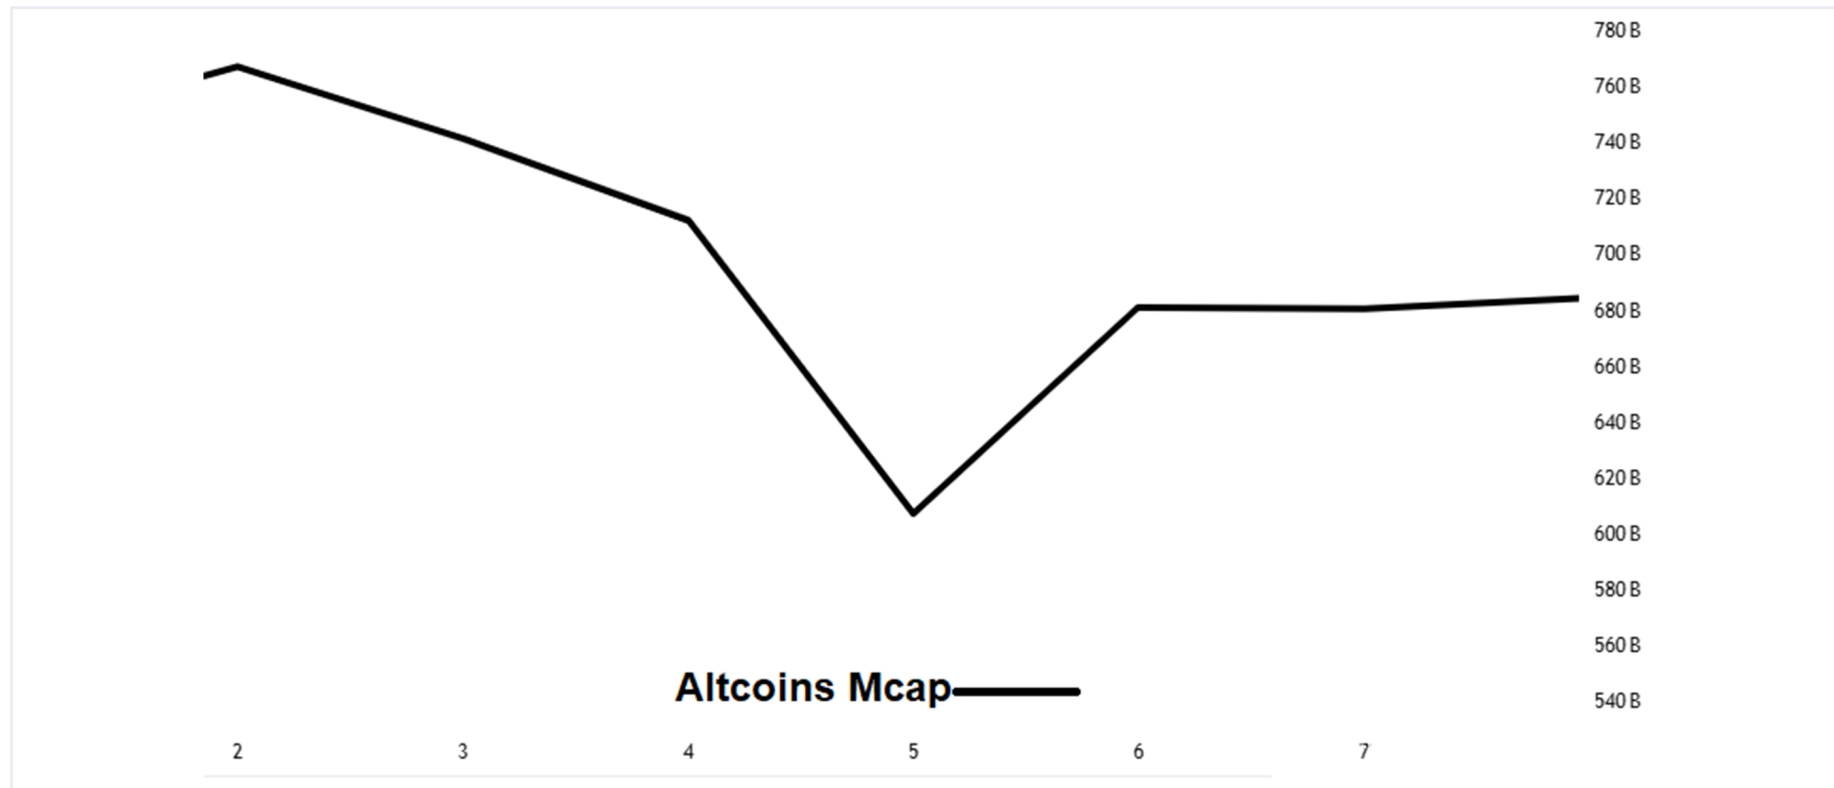

STABLECOINS WEEKLY OVERVIEW

Stablecoin dominance started the week at 11.9% and saw a significant surge as market volatility increased. On February 5th, dominance spiked to 14.48%, reflecting substantial capital flowing into stablecoins as investors sought safety during the sharp market decline. This movement is typical during periods of heightened uncertainty, where traders de-risk their positions by converting volatile assets into stable holdings. Stablecoin dominance has since cooled off to 12.9%, suggesting some capital is beginning to rotate back into risk assets as the market stabilizes. This normalization indicates cautious optimism returning to the market.

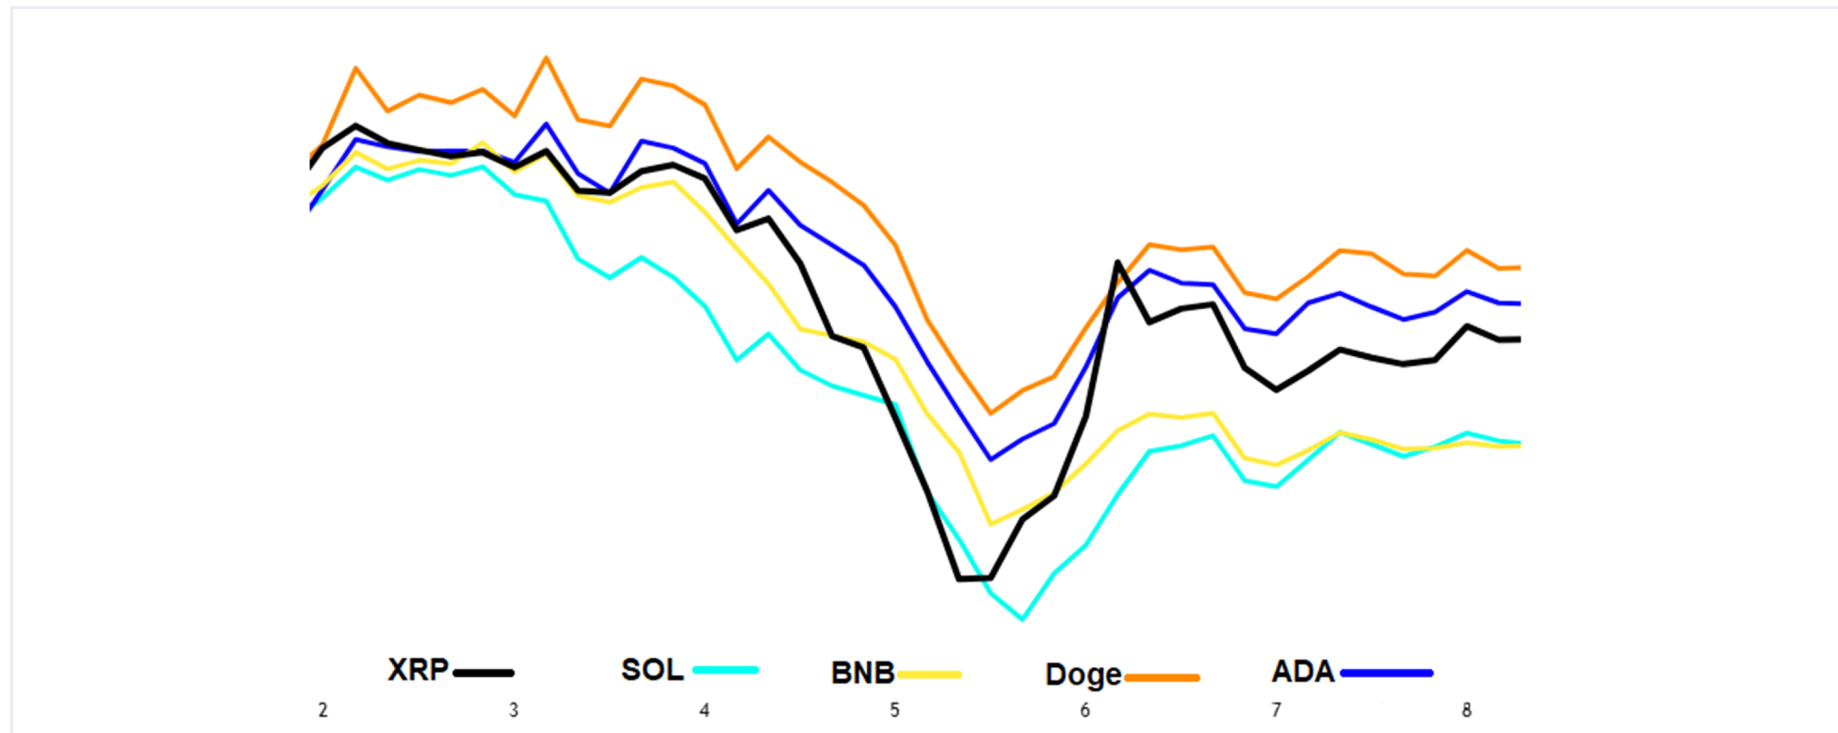

ALTCOINS MARKET CAP WEEKLY OVERVIEW

The altcoins market cap started the week at \$760B but faced severe selling pressure alongside the broader market downturn. Altcoins dropped to \$570B, representing a sharp -25% correction from the weekly open. This decline underscores the heightened volatility typically seen in the altcoin sector during market wide liquidations. However, the market has since recovered to \$683B, demonstrating resilience as buyers stepped back in at lower levels. While the recovery is encouraging, altcoins remain below the weekly opening levels, indicating that the market is still in a consolidation phase following the recent volatility.

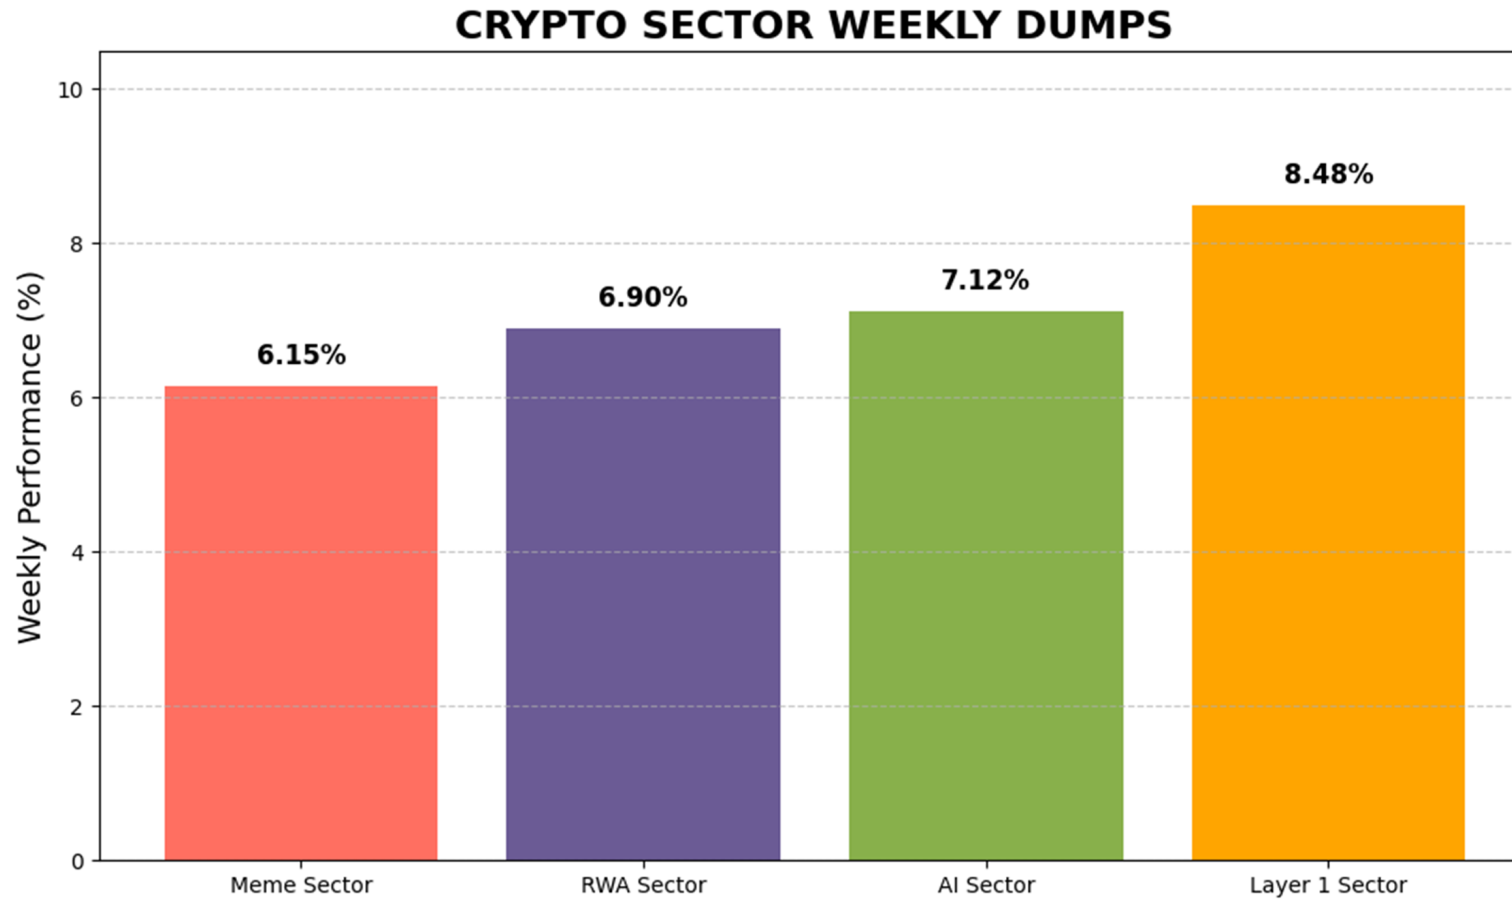

MAJOR ALTCOINS WEEKLY OVERVIEW

XRP opened the week at \$1.59 but was caught in the broader market selloff, dropping to \$1.11 on February 5th before recovering to its current level of \$1.43. Cardano (ADA) started at \$0.29, declined to \$0.22 during the downturn, and has since rebounded to \$0.27. Solana (SOL) experienced significant volatility, beginning the week at \$101, falling to \$67 on February 5th, and currently trading at \$86. Dogecoin (DOGE) followed a similar pattern, opening at \$0.108, touching a low of \$0.079 on February 5th, and now sitting at \$0.09. BNB started the week at \$757, dropped to \$572 during the market correction, and has recovered to \$639. Overall, major altcoins experienced substantial drawdowns ranging from 20-35% but have since posted recoveries of varying degrees, with most tokens still trading below their weekly opening levels as the market continues to digest the recent volatility.

Coin Name	Price	7-DAY Change

DCR 	\$25.40	▲+9.52%

CRYPTO SECTORS WEEKLY PERFORMANCE

MARKET SENTIMENT AND ON-CHAIN DATA

BITCOIN FEAR & GREED

Fear dominated the crypto market throughout the week of January 31 to February 6, with sentiment remaining in extreme negative territory. The week opened with a reading of 14 on January 31, holding steady at this level through February 1 and 3. On February 2, there was a brief uptick to 17, marking the week's most optimistic point. The most dramatic shift occurred on February 5, when fear intensified sharply, pushing the reading down to 9 the lowest level since June 2022. This represented peak pessimism among market participants during the week. By February 6, sentiment improved slightly to 11, though anxiety remained extremely elevated. Throughout the entire seven-day period, fear levels stayed consistently high, with scores never moving above 25. The relatively stable pattern, except for the sharp drop on February 5, demonstrates that negative emotions and caution controlled market psychology without any meaningful relief. This sustained wave of pessimism defined the overall mood in crypto markets during this particular week.

BITCOIN VOLATILITY WEEKLY OVERVIEW

From January 31 to February 6, Bitcoin showed a clear drop in price while market volatility increased. Bitcoin started the period near \$77k and moved slightly higher at first, but then selling pressure increased and the price fell sharply to around \$62–63k. During this decline, GARCH volatility kept rising and reached above 55%, showing higher uncertainty and fear in the market. Toward the end of the period, Bitcoin made a small recovery to around \$65k, while volatility began to cool down slightly. Overall, the data suggests that the price drop was strongly linked with rising volatility, which is typical during market corrections.

BITCOIN ACTIVE ADDRESSES WEEKLY OVERVIEW

From January 31 to February 6, Bitcoin price declined while network activity increased. Bitcoin started near \$77k and moved slightly higher at the beginning, but then faced strong selling pressure and dropped sharply to around \$62–63k. During this drop, daily active addresses kept rising and peaked near 845k, showing increased on-chain activity despite the price fall. This suggests that more users were active on the network, likely due to panic selling, position adjustments, or dip buying. Toward the end of the period, Bitcoin price recovered slightly to around \$65k, while active addresses began to cool down. Overall, network activity stayed strong even as price corrected, which is often seen during volatile market phases.

BITCOIN SPOT ETF WEEKLY OVERVIEW

From February 2 to February 6, Bitcoin spot ETF flows were mostly negative, showing weaker institutional demand during the week. The week started with a strong inflow of around \$0.56B on Monday, but sentiment quickly shifted. Over the next few trading days, ETFs saw steady outflows, with the largest outflow of about \$0.55B on Wednesday. This selling pressure from ETFs aligned with the broader market correction seen in Bitcoin price during the same period. Overall, ETF flows suggest that institutions reduced exposure after the early-week inflow, reflecting a more cautious stance in the market.

MAJOR ASSETS PERFORMANCE

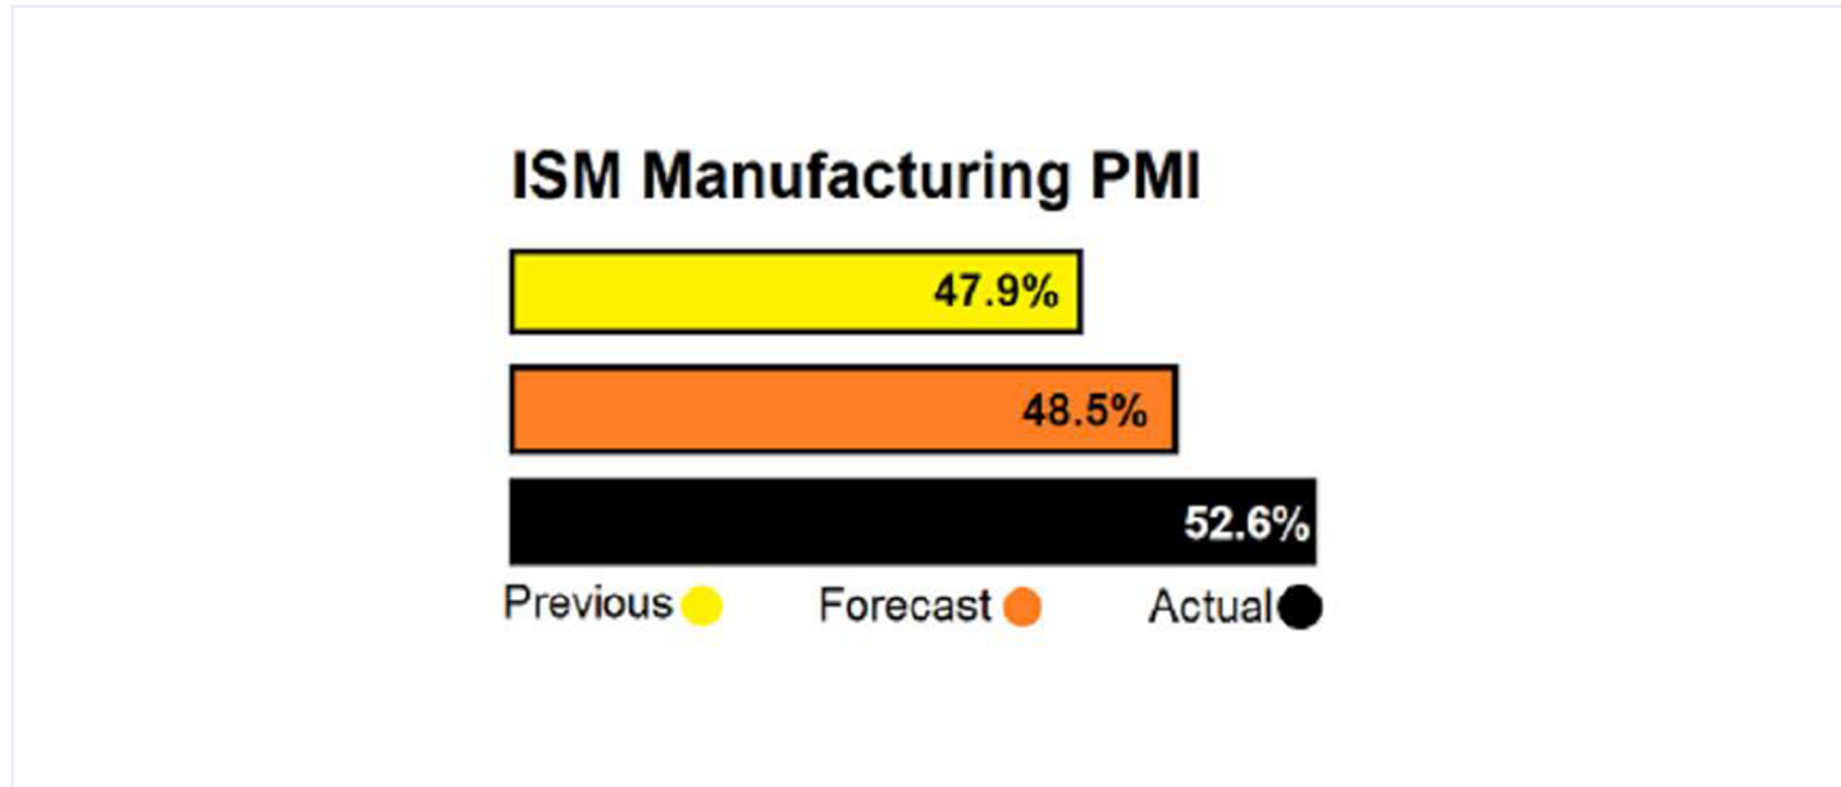

MACROECONOMICS OVERVIEW

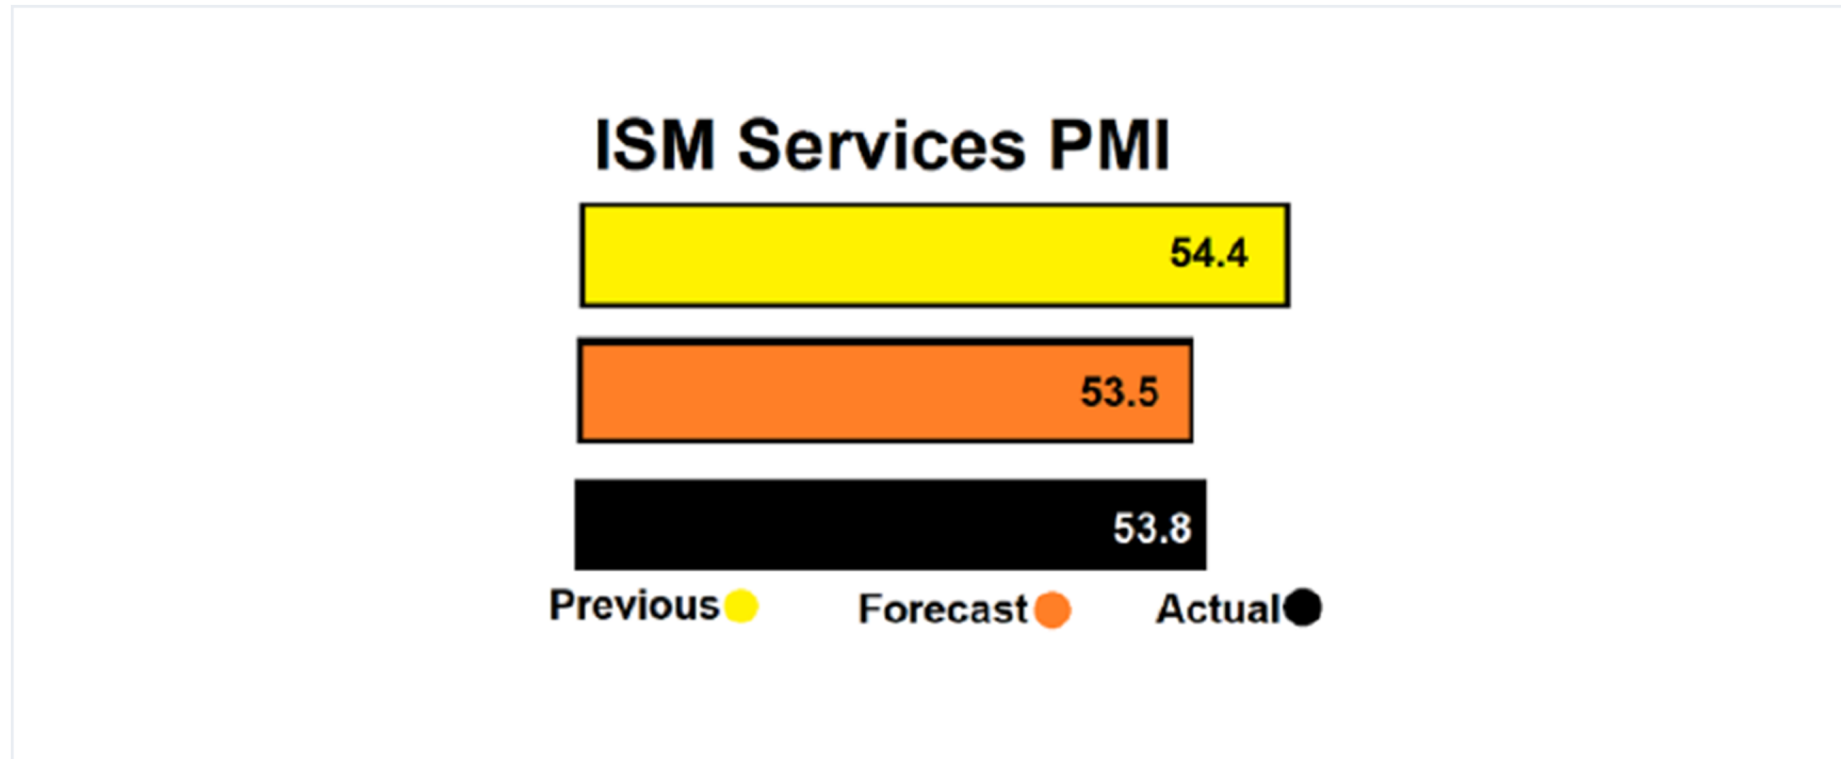

ISM MANUFACTURING PMI

This week, on February 2, the ISM Manufacturing PMI was released at 52.6, much stronger than the previous 47.9 and above the forecast of 48.5. A reading above 50 indicates growth in the US manufacturing sector. The stronger-than-expected data was bullish for the US dollar and had a bearish impact on broader markets

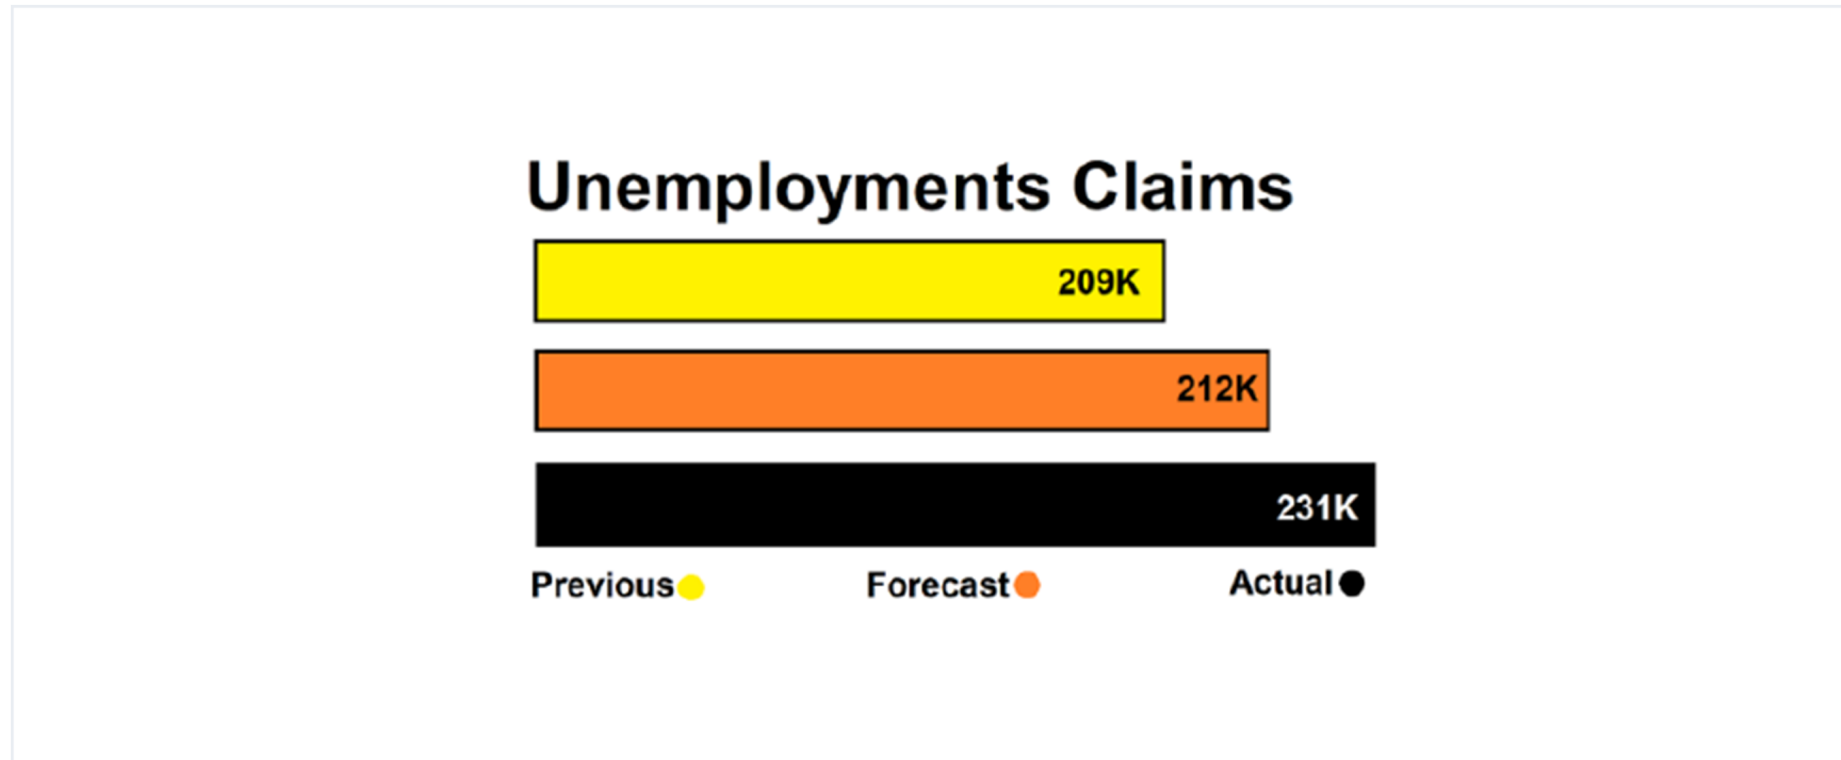

ISM SERVICES PMI

On February 4, the ISM Services PMI was released at 53.8, slightly above the forecast of 53.5 but below the previous reading of 54.4. This indicates that the US services sector continues to expand, though the pace of growth is slowing. The data shows the economy is still growing, but momentum is easing. Overall, the impact on the market is neutral, as it does not signal a major change in economic activity.

UNEMPLOYMENT'S CLAIMS

On February 5, Unemployment Claims were reported at 231K, higher than the forecast of 212K and the previous 209K. This indicates that the job market is slightly weaker than expected. The data is generally negative for the US dollar but bullish for the market, as it reduces the likelihood of aggressive interest rate hikes by the Fed in the near term.

NEWS

CHINA TIGHTENS ITS CRYPTO RULES

China stepped up action against unauthorized stablecoins and said it will more closely check real-world asset tokens. This shows China is still strict on crypto activity. At the same time, it is open to controlled tokenization, as long as it stays under regulation.

TRADFI DERISKING HITS CRYPTO MARKETS

According to a Bitwise advisor, the February 5 selloff was not caused by problems inside crypto. Instead, traditional financial markets reduced risk across the board. When big investors pull money from risky assets, crypto often feels the impact first.

ETHEREUM FUNDING RATES TURN NEGATIVE

Ethereum funding rates dropped across major exchanges, showing a clear shift in trader mood. More traders are betting on downside, which matches ETH's price weakness during the week. This points to short-term caution in the market.

ANALYSTS SEE EARLY SIGNS OF A POSSIBLE BOTTOM

Bernstein noted that the current crypto downturn may be near its later stages. They suggest Bitcoin could be forming a bottom around the \$60K level. Institutional interest and macro conditions may help support prices later in 2026.

FINAL THOUGHTS

FINAL THOUGHTS

This week reminded everyone that crypto markets can turn violent quickly. A 20% drop across the board isn't pleasant, but it's not unprecedented either. What stands out is how fast the recovery happened. Bitcoin bouncing from \$59,000 to \$71,000 in a matter of days shows there are buyers waiting at these levels. The selloff came from outside forces, not internal collapse. Traditional markets got spooked by strong economic data that reduces the chance of rate cuts. When that happens, money flows out of risky assets, and crypto usually leads the way down. The good news is that crypto fundamentals didn't break. Network activity stayed strong, real users remained engaged, and institutional interest didn't completely disappear.

The technical picture is messy right now. Former support levels at \$73,000 for Bitcoin and \$2,050 for Ethereum are now resistance. These need to be reclaimed for any bullish case to stick. Until that happens, we're in a consolidation phase where the market digests what just happened and figures out the next move. Fear hit extreme levels, which is actually a contrarian signal. When the Fear and Greed Index drops to 9, it usually means most of the weak hands have already sold. The spike in stablecoin dominance to 14.48% shows massive amounts of capital sitting on the sidelines in dry powder. That money will eventually look for entry points.

Altcoins took it on the chin harder than Bitcoin, which is normal during corrections. But the recovery in tokens like Solana and XRP shows there's still demand for quality projects at the right price. The fact that Bitcoin dominance didn't surge dramatically during the crash suggests the altcoin market isn't dead. Looking ahead, the next few weeks matter a lot. Bitcoin needs to close weekly candles above \$73,000 to shift momentum. Ethereum has to break and hold above \$2,050. If that happens, the door opens for a continuation of the broader uptrend. If not, we might test lower levels again before finding a more durable bottom.

Institutional flows will be worth watching. The flip from \$0.56 billion inflows to \$0.55 billion outflows in just a couple of days shows how quickly sentiment can change. If ETFs start showing consistent positive flows again, it would signal that the correction is over and smart money is accumulating. The macro environment remains uncertain. Strong economic data is actually a double-edged sword. It's good for the economy but reduces the urgency for Fed rate cuts, which keeps the dollar strong and pressures risk assets. Traders need to pay attention to upcoming employment and inflation data for clues about where markets head next.

China's expending the 2021 ban on stablecoins is worth monitoring, but it's not a new story. China has been hostile to crypto for years. The fact that they're willing to explore controlled tokenization suggests there might be room for regulated crypto activity in the future, which could be a long-term positive. Some analysts are calling for a bottom around \$60,000 for Bitcoin, and that makes sense given the reaction we saw at those levels. Strong buying came in fast, network activity surged, and prices bounced hard. That's what bottoms often look like, at least for the short term.

The risk is that this was just a relief bounce within a larger corrective move. If Bitcoin can't reclaim \$73,000 soon and falls back toward \$65,000 or lower, the bear scenario starts looking more likely. Multiple failed attempts to break resistance would confirm that sellers are in control. For now, the market is at a crossroads. The quick recovery is encouraging, but the broken support levels are concerning. Traders should watch price action around these key zones closely and be ready to adjust positions based on what happens next. This isn't the time for overconfidence in either direction.

What's clear is that crypto isn't going away. Even during the panic selling on February 5, network activity hit 845,000 active addresses. Real people are using Bitcoin, building on Ethereum, and trading across the ecosystem. That underlying activity is what matters most in the long run. The correction was painful but possibly necessary. Markets that only go up eventually face much worse crashes. A healthy pullback that shakes out leverage and resets sentiment can set the stage for more sustainable growth. Whether this correction is over or has more to go remains to be seen.

MARKET SCENARIOS & OUTLOOK

BULL SCENARIO

Bitcoin reclaims the \$73,000 level with strong daily closes above this zone. This would confirm the support flip back to its original role and signal renewed bullish momentum. Ethereum follows through by breaking above \$2,050 with conviction, opening the door for a move toward previous highs. Institutional money returns as Bitcoin ETFs shift back to positive flows. The early-week inflow of \$0.56 billion demonstrated that appetite still exists. If traditional markets stabilize and risk appetite improves, we could see sustained institutional buying pressure return.

The fear index normalizes back above 25-30 as confidence rebuilds. Stablecoin dominance drops back toward 11-12% as capital rotates out of safety and back into risk assets. This would indicate traders are willing to deploy capital again rather than sitting on the sidelines. Altcoins lead the recovery with strong rallies from oversold conditions. Tokens like Solana, which dropped to \$67, have room to run back toward \$100-110 if market conditions improve. The altcoin market cap moving back above \$760 billion would confirm broad participation in the recovery.

Network fundamentals remain strong throughout. Bitcoin active addresses staying elevated near 800,000+ shows real users are engaged and not just fleeing the market. Combined with decreasing volatility back toward normal ranges, this creates a foundation for sustainable growth. China's regulatory stance becomes clearer and more constructive. If controlled tokenization within regulatory boundaries gains traction, it could open new avenues for institutional participation, especially for real-world asset tokens under proper oversight. Macro conditions shift favorably. If unemployment continues to tick higher and the Fed signals potential rate cuts later in 2026, it would create a more supportive environment for risk assets. Weakening dollar strength would also reduce headwinds for crypto.

BEAR SCENARIO

Bitcoin fails to reclaim \$73,000 and continues trading below this resistance level. Multiple rejections at this zone would confirm the bearish structure and open the door for another leg down. A break below the recent \$59,000 low would trigger more liquidations and could send Bitcoin toward the \$50,000–55,000 range. Ethereum struggles to break above \$2,050 resistance and instead falls back toward \$1,740 or lower. If this support breaks, the next major zone sits around \$1,500–1,600, which would represent another 15–20% decline from current levels.

Institutional outflows accelerate. If Bitcoin ETFs continue showing net outflows beyond the \$0.55 billion seen on Wednesday, it signals that big money is exiting positions. Sustained selling pressure from institutions could overwhelm retail buying interest. Fear deepens as the index drops below the recent low of 9. This would indicate capitulation-level selling and potentially push stablecoin dominance even higher toward 15–16%. When panic reaches these extremes, price declines often accelerate before finding a bottom.

Altcoins break down further from current levels. If major tokens like Solana drop below \$60, XRP falls under \$1, and Cardano breaks \$0.20, it would signal a broader loss of confidence across the entire crypto ecosystem. The altcoin market cap dropping below \$570 billion would represent new cycle lows. Traditional markets continue derisking. If stock market volatility picks up and investors flee risky assets across the board, crypto will likely face additional selling pressure. Strong economic data that keeps the Fed hawkish would maintain dollar strength and pressure risk assets.

China's regulatory crackdown expands beyond stablecoins. If authorities target more areas of crypto activity or if other major economies follow suit with restrictive policies, it could create a prolonged regulatory overhang that dampens sentiment and participation. Network activity declines significantly. If Bitcoin active addresses drop below 700,000 and stay there, it would suggest users are leaving the ecosystem rather than accumulating at lower prices. This would be a concerning sign for longer-term health.
